

CLAMP TITE™

INSTRUCTIONS FOR USE

To Make a Hose Clamp

1. Measure the diameter where the clamp will be applied. Cut wire to length (15 times the diameter plus 12 inches.) Fold the wire in the middle to make a loop.
2. Wrap the free ends of the wire around the assembled hose and fitting, and pass both free ends through the loop together. Go around once, twice, or more for a stronger clamp. **(Figure 1)**
3. Push the notch in the nose of the tool against the loop. Pull the free wires over the short pin, and wrap around the long hollow pin on each side of the Clamptite™. Then twist the free ends together. **(Figure 2)**
4. Turn the wing nut to draw the threaded rod out of the cylinder. This pulls the wire tight around the hose and forms the clamp. **(Figure 3)**
5. When the wire is tight enough, rotate the tool over the loop. This clinches the wire clamp. **(Figure 4)**
6. Clip the wire with diagonal cutters near the nose of the tool, leaving about ¼ inch tails. Snug the tails down, and the clamp is done.

Most users learn to complete these steps in under 1 minute without hurrying.

Quick and easy alternative style wrap. (Not for hose clamps.)

Rig and wrap the wire one or more turns.

Turn the nut or knob to tighten.

Rotate the tool 360 degrees as shown in STEP 2 below to lock the wrap. Then clip the wire ends leaving about 1/4 inch tail.
